MTH305 Risk Management

Assessment #002 – Part Two: Evidence-Based Marking Criteria and Rubric

Total: 50 marks

Core principle

This assessment does **not** reward a polished or "perfect" answer by itself.
High marks require **traceable evidence of the student's own understanding, judgement, learning and improvement** across:

Part One baseline → VP challenge → student response/judgement → revision → reflection

A response that is generic, decontextualised, or disconnected from the submitted evidence cannot receive high marks, even if it is well written.

Q4. Professional interview with the VP AI Agent — 15 marks

Criterion	Marks	Strong evidence	Adequate evidence	Limited evidence
Knowledge understanding	5	Explains VaR and related risk concepts accurately in own words; recognises assumptions and limitations	Mostly correct understanding with minor gaps	Significant conceptual errors or formulaic explanation without real understanding
Real-world application and judgement	6	Applies results to capital allocation and risk decisions; considers uncertainty, limitations, changing conditions and practical consequences	Some appropriate application, but judgement is partly underdeveloped	Generic discussion with weak connection to the actual portfolio or decision context
Ownership of response	4	Answers the exact VP question directly; uses own Part One analysis; can justify, qualify or defend the answer when challenged	Relevant and mostly specific, but reasoning is not always well supported	Highly generic, rehearsed, inconsistent with Part One, or unsupported

Q4 evidence rule

The interview itself is the evidence. Mark what the student **actually says in response to the VP**, not how polished the language sounds.

High marks require answers that are specific to the student's own analysis and the VP's actual question.

Q5. Improve the report with the VP — 25 marks

Criterion	Marks	Strong evidence	Adequate evidence	Limited evidence
Quality of revised report	7	Final report is more accurate, decision-relevant and appropriately qualified than the original	Clear improvement, but some judgement or interpretation remains weak	Mainly cosmetic changes or weak professional interpretation
Traceable evidence of improvement	10	Each major change shows a clear chain: **original weakness/claim → VP question/feedback → student judgement → change → reason**	Some changes are traceable, but links are incomplete or uneven	Changes are listed without convincing evidence of how or why they arose
Critical use of VP feedback	5	Student accepts, modifies or rejects feedback with clear reasoning; does not follow AI automatically	Feedback is used sensibly, with some independent judgement	VP feedback is copied, accepted automatically, or rejected without justification
Consistency and ownership	3	Revised report, improvement record and VP discussion are coherent and mutually consistent	Mostly consistent, with minor gaps	Important contradictions or unexplained changes between stages

Q5 evidence rule

A polished revised report is **not enough**.

High marks require visible development from the student's own original work.

For each important change, markers should be able to identify:

1. **What was weak, incomplete or questionable before?**
2. **What did the VP challenge or suggest?**
3. **What did the student decide?**
4. **What changed?**

5. **Why is the revised version better?**

Q5 mark cap

If the improvement record does not provide a credible, traceable development process, **Q5 should normally be capped at 13/25**, regardless of how polished the revised report is.

Q6. Critical reflection on AI-supported learning — 10 marks

Criterion	Marks	Strong evidence	Adequate evidence	Limited evidence
Evidence-based critical reflection	4	Uses specific evidence from the VP interview and revision process to analyse what changed, why it mattered and what was learned	Reflection refers to relevant experience, but analysis is partly general	Mostly descriptive or generic reflection with little connection to the student's own evidence
Development of understanding and judgement	3	Shows clearly how the process developed the student's understanding, judgement or decision-making beyond the original submission	Some development is identified, but explanation is limited	Little evidence that understanding or judgement developed
Critical evaluation of AI-supported learning	3	Evaluates the value and limitations of the AI-supported process and explains how the student would use AI more effectively in future	Identifies some strengths, limitations or future-use considerations	Treats AI uncritically or gives generic comments without personal insight

Q6 evidence rule

Students are **not required to address every suggested question in the assessment brief**.
Markers should judge the quality of the reflection as a whole.

High marks require the reflection to be anchored in the student's **own VP interview and revision process**.

Strong reflection may refer to:

- a VP question that exposed a weakness;
- feedback the student accepted, modified or rejected;
- a change in understanding or professional judgement;
- a limitation of AI-supported learning recognised through the experience;
- how the student would interact with AI differently in future.

Q6 mark cap

A reflection that remains generic and does not refer to identifiable evidence from the student's own work should normally be capped at **5/10**.

Evidence standard across the assessment

High-mark evidence

- Specific reference to the student's own Part One analysis.
- Clear links between VP questions or feedback and subsequent decisions.
- Evidence that the student can explain **why** a conclusion is appropriate.
- Recognition of uncertainty, assumptions and limitations.
- Justified acceptance, modification or rejection of AI feedback.
- Visible improvement between the original and revised work.
- Consistency across interview, VP discussion, revised report and reflection.

Weak evidence

- Generic answers that could apply to any student or portfolio.
- Perfect-sounding statements with no connection to Part One.
- Copying or closely paraphrasing VP feedback.
- Changes made without explaining the reasoning.
- Reflection that could have been written without completing the VP interaction.
- Contradictions between the interview, improvement record and final report.

Quick marker questions

- **Q4:** Does the student genuinely understand and apply the risk concepts, or merely produce plausible language?
- **Q5:** Can I trace how the student's thinking and report changed after professional challenge?
- **Q6:** Does the reflection show specific evidence of learning, development and critical evaluation of AI-supported learning?

> **Final principle:** assess the evidence of thinking and development, not the apparent perfection of the final answer.
